Keep the review moving.

Parth Pawar · Formbricks #8650 · Continuous review working draft · 26 October 2026

The brief was to make Change Stack easier to use without losing what it can do. I focused on understanding a change, checking the code and keeping my place. Developer exploration exposed a mistake in my first version: I had removed useful signals while simplifying the screen. This revision responds to that feedback. It is not a completed usability study.

Keep the useful signals

I restored layer numbers, file counts, additions, deletions and recorded severity. Layers start compact; expanding files and opening a layer are separate actions. The first context view explains the file, shows the captured finding's status and leaves summaries collapsed. Complexity, severity and resolution keep their own labels.

Read, then inspect

Opening a summary reveals the explanation without moving the code. Statement links take you to specific lines; the whole range and source wording remain available. Inspect and Return preserve the caller's position. One continuous stream lets you keep going through files. Equal-width Split stays familiar, with real deletions and unchanged context.

Use Overview to get oriented

Overview holds the pinned PR context, source-ordered layers and recorded findings. Severity filters narrow this table without reordering the review. A small curated permission-check path links to workspace access, tenant resolution and record ownership. Return restores the previous reading position.

Keep state clear and code readable

Viewed is the primary progress count. Summary Seen is separate; scrolling changes neither. Major · Resolved reads as history. Range notes retain their file, side and lines, and stay local. Reviewing controls take 92 px. Light, Dark and System use semantic colors; switching themes preserves drafts and position. Dark colors are derived, not claimed as captured product tokens.

What still needs checking

All 52 pinned GitHub diffs (+5,722 / −127) are checked against before/after content. Nine layer assignments are verified; 43 assignments, the source comparison base and live Split behavior remain release gates. Public links are unchanged. Summary and thread coverage is partial. The source uses both Trivial and Nitpick; I keep those labels rather than silently treating them as identical. Narrow highlights can hide context, so whole ranges stay available.

The next evidence

Next I'd compare the same permission-review task in both versions: explain the checks, inspect the guard, return and leave a range note. I'd record missed checks, lost position and help needed. I haven't measured faster or more accurate reviews.

Pinned commit 23cdac2d791c · Paper requires sign-in · Public submission links are unchanged.
