What I changed in Change Stack

CodeRabbit Change Stack | Formbricks #8650 | Parth Pawar

I wanted to keep the file, explanation, and review progress connected. I kept file-by-file review and changed how you move between those things.

What got in the way	What I changed
The layer, file path, and file position are spread across the screen.	I kept the layer, file, and path together. Previous and Next switch files directly; the position opens the searchable nine-file list. Each file keeps its reading position.
Several rows of file controls compete with the diff.	I put frequent file actions in one toolbar and kept Submit review in the PR header. Focus condenses the heading and hides both side panels without losing your place.
The 37-summary count belongs to the layer. access.ts has six.	I labeled both counts and kept the summary-to-code link. Matching highlights preserve green addition text. The full captured summary expands without losing its place when marked seen.
Seen summaries, viewed files, and a submitted review mean different things.	PR progress and the seven included demo files have separate counts. Opening a file never marks it viewed. Summary seen and the final decision stay separate. Viewed changes can be undone.

The right panel takes space

Context takes code width. Z hides it; below 1280px it becomes an overlay. Split has continuous panes and optional line wrapping. Local notes have their own index, separate from source comments.

What I checked

The comparison keeps all seven imports, the full source summary, and captured layer progress. I checked file switching, linked ranges, draft recovery, Undo, keyboard access, and dialog focus. I haven’t measured a speed improvement or tested this with developers.

What I’d test next

I’d test tighter statement anchors, paired-file inspection, and a review-wide private question queue separately. Each sketch uses this PR and states its tradeoff. None is part of the working prototype.

This uses the out-of-date Formbricks #8650 snapshot at 23cdac2. Seven of 52 diffs are included. Other content is labeled as a preview; not every source workflow is implemented. Submitting a review is simulated and sends nothing.
