What I changed in Change Stack

CodeRabbit Change Stack | Formbricks #8650 | Parth Pawar

The original has a lot competing with the code. I kept the layer structure and focused on making it easier to see which file you're reviewing, how a summary relates to its code, and what you've finished.

What got in the way	What I changed
The layer, file path, and file position are spread across the screen.	I kept the layer, file, and path together. Previous and Next switch files directly; the position opens the searchable nine-file list. Each file keeps its reading position.
Several rows of file controls compete with the diff.	I put the frequent file actions in one toolbar and left Submit review in the PR header. The other tools are still available by name.
The 37-summary count belongs to the layer. access.ts has six.	I labeled both counts and kept the summary-to-code link. Matching highlights help you follow the jump. The full captured summary expands when you need the detail.
Seen summaries, viewed files, and a submitted review mean different things.	File progress leads in the header: viewed and left to check. Summary seen stays in context as a reading aid. Opening a file doesn't mark it viewed. Undo corrects that choice; Submit review remains separate.

The right panel takes space

The right panel leaves less room for code. Z hides the side panels and keeps your current reading position when they return. Below 1280px, context opens as an overlay.

What I checked

The comparison keeps the original imports, full workspace-tenant summary, and captured layer progress. I checked file switching, summary jumps, Undo, keyboard controls, and dialog focus. Reading positions and file/line notes survive navigation. I'd still test whether developers can find a file and tell what's left. I haven't measured a speed improvement.

This uses the out-of-date Formbricks #8650 snapshot at 23cdac2. Seven of 52 diffs are included. Other content is labeled as a preview; not every source workflow is implemented. Submitting a review is simulated and sends nothing.
